# Cyrillic Generation Panel

Dušan Stojičević | TLDCON 2015 | 10 September 2015

In general – what is LGR

Label Generation Rules (LGR) for the Root Zone determine which Unicode code points are permitted in the root zone, which variant labels (if any) may be allocated in the root zone, and which variant labels (if any) are automatically blocked.

Each community sharing a script (such as Cyrillic) forms a Generation Panel and submits a proposal for rules governing what characters of its script are to be allowed into the root as well as identifying variant code points and their respective rules. The Integration Panel then evaluates each of these proposals and integrates them into a coherent Root Zone LGR. In doing so, the Integration panel considers the safety and security of the DNS as well as any interaction between scripts.

In general – Cyrillic GP

The purpose of a Generation Panel is to create a proposed set of Label Generation Rules (LGR) for a given script or writing system used by a community of Internet users. The LGR proposed by the Generation Panel defines how the script can be supported in the Root Zone and will be reviewed by the Integration Panel for possible integration into the Root Zone LGR. Forming a Generation Panel is thus the crucial first step in the development of the Label Generation Rules (LGR) for IDNA labels for the Root Zone.

Generation panels are formed within the respective communities and are composed of volunteer members with deep experience or interest in the given script, or writing system. Some communities have existing working groups on IDNs and Variant IDNs.

Cyrillic GP

After a year, Cyrillic GP is active, but stuck in a starting stage of creating a Proposal for the Generation Panel

Main problem in GP:
Luck of Russian and Middle Asia participants

Possible consequences:
No new Cyrillic TLDs

How to join:
CyrillicGP@icann.org

Thank You!
